

# Understanding Used Sailboat Prices

## Math 42 Final Project

Melissa Chang, Ruei-yu (Michelle) Chang,  
Khang Thai, Kenneth Chow, Charles Wei

# Background

- The second-hand sailboat market has been significantly growing throughout the years.
- Determining used sailboat prices has been challenging due to factors such as regional economic and climate conditions have made it difficult to accurately determine the price for each sailboat variant.
- Creating a model that includes various factors that influence used sailboat prices can give us a better understanding and provide a more precise estimate of sailboat values.

# Problem

- Develop a mathematical model that explains the listing prices of each of the sailboats
- Include additional features such as Make, Variant, Length, Geographic Region, Listing Price, Year, Beam, Draft, Displacement, and Fuel Capacity to construct a regression model with multiple independent variables.
- Impact of geographic regions on the pricing of different types of sailboats based on the established model.
- Use the model to explain the importance of the given geographic regions in the Hong Kong market.
- Find additional interesting and informative inferences from the dataset.

# Assumptions

- Features that affect price are limited to **Make, Variant, Length, Region, Country, Year, Beam, Draft, Displacement, and Fuel Capacity** and are not affected by human factors.
- We assume all **market conditions** are stable, and factors such as inflation or financial crisis will not affect the price of used sailboats.
- For economic metrics, we will classify Europe as the European Union and UK.
- We assume all **sellers list the price rationally**, based on their consideration of the condition of the used sailboat itself.

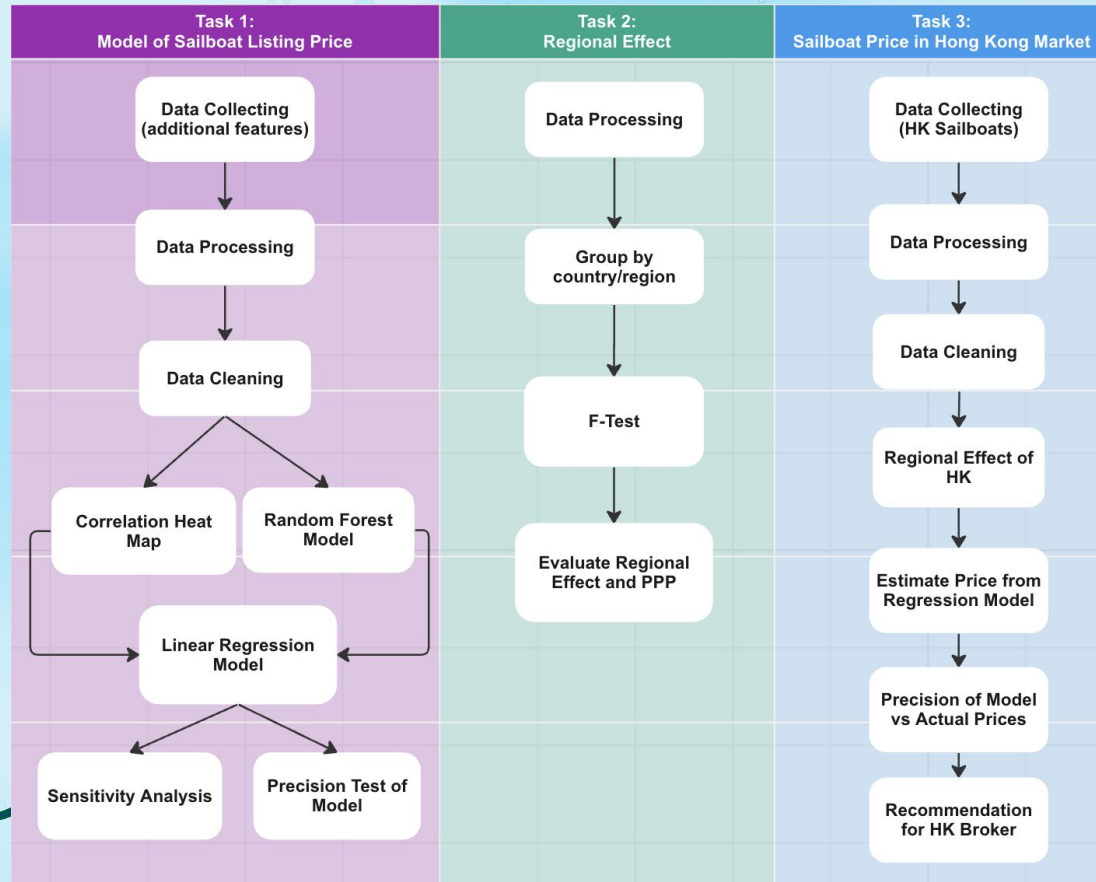

**Monohulled Sailboat**

**Catamaran**

# Modeling Approach

# Data processing

| Make    | Variant    | Length (ft) | Geographic Region | Country/Region/State | Listing Price (USD) | Year | Average PPP (\$) |
|---------|------------|-------------|-------------------|----------------------|---------------------|------|------------------|
| Alubat  | Ovni 395   | 41          | Europe            | France               | \$267,233           | 2005 | 38,770           |
| Bavaria | 38 Cruiser | 38          | Europe            | Croatia              | \$75,178            | 2005 | 23,716           |
| Bavaria | 38 Cruiser | 38          | Europe            | Croatia              | \$66,825            | 2005 | 23,716           |
| Bavaria | 38 Cruiser | 38          | Europe            | Croatia              | \$54,661            | 2005 | 23,716           |
| Bavaria | 38 Cruiser | 38          | Europe            | Croatia              | \$53,447            | 2005 | 23,716           |
| Bavaria | 38 Cruiser | 38          | Europe            | Greece               | \$91,101            | 2005 | 27,542           |
| Bavaria | 39 Cruiser | 39          | Europe            | Greece               | \$66,748            | 2005 | 27,542           |
| Bavaria | 42 Match   | 41          | Europe            | Croatia              | \$78,945            | 2005 | 23,716           |
| Bavaria | 42 Match   | 41          | Europe            | Croatia              | \$58,297            | 2005 | 23,716           |

| Make            | Variant    | Length (ft) | Geographic Region | Country/Region/State | Catamaran Listing Price (USD) | Year | Average PPP (\$) |
|-----------------|------------|-------------|-------------------|----------------------|-------------------------------|------|------------------|
| Lagoon          | 380        | 38          | Caribbean         | Martinique           | \$204,921                     | 2005 | 14400            |
| Lagoon          | 380        | 38          | Caribbean         | Guadeloupe           | \$200,071                     | 2005 | 38,770           |

# **First attempt: Correlation Heat Map**

# Correlation Heat Maps

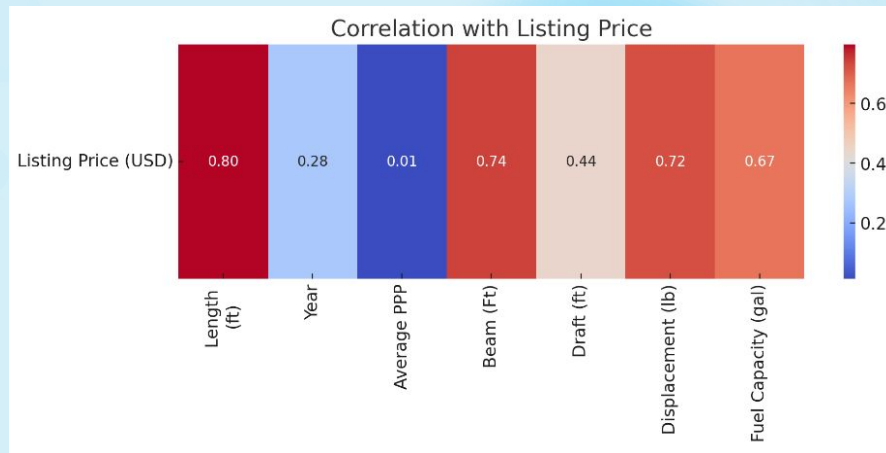

**Correlation heat map for monohulled with 3 features**

# Correlation Heat Maps

Correlation heat map for catamaran with 3 features

# Correlation Heat Maps

Correlation heat maps for sailboats with additional features

# **Second attempt: Random Forest Regression Analysis**

# Random Forest Results

## Random Forest Regression Analysis for Monohulled with 3 Features:

- Length: **42.3%** importance
- Year: **30.7%** importance
- Average PPP: **27.0%** importance

## Random Forest Regression Analysis for Catamarans with 3 Features:

- Length: **61.94%** importance
- Year: **27.98%** importance
- Average PPP: **10.08%** importance

# Random Forest Results

## Random Forest Analysis for Monohulled with Additional Features:

- Fuel Capacity: **56.9%** importance
- Year: **20.5%** importance
- Length: **6.7%** importance
- Beam: **6.6%** importance
- Draft: **4.7%** importance
- Average PPP: **4.6%** importance

## Random Forest Regression Analysis for Catamarans with Additional Features:

- Length: **57.1%** importance
- Beam: **17.1%** importance
- Displacement: **6.7%** importance
- Year: **5.9%** importance
- Average PPP: **5.8%** importance
- Fuel Capacity: **4.4%** importance
- Draft: **3.0%** importance

# Model Evaluation

# Exploring Relationships

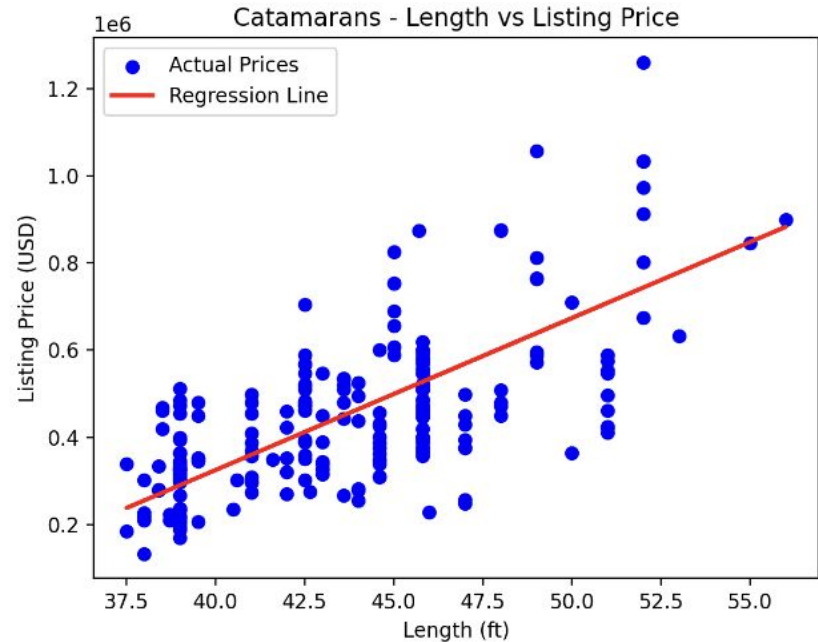

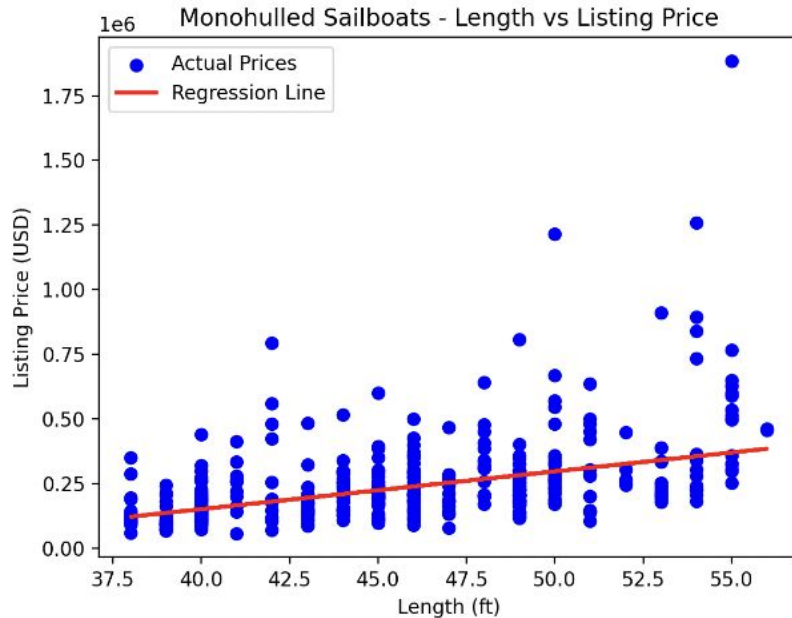

Correlation Coefficient:

**0.47692332391093106**

Correlation Coefficient:

**0.6839815819823276**

# Regression Model

**P = Price, x1 = Length (ft), x2 = Year, x3 = Average PPP (\$USD)**

## Monohull Sailboats:

$$P = 15187.13 * x_1 + 12450.62 * x_2 + 3.81 * x_3 - 25625815.47$$

$$R^2 = 0.4046372858405721$$

## Catamarans:

$$P = 34204.91 * x_1 + 22645.16 * x_2 + 1.86 * x_3 - 46691648.54$$

$$R^2 = 0.731602780282924$$

# Precision of Model

## Chi-Square Test

### Monohull Sailboats:

- Chi-Square: 1464.04448022151
- P-value: 2.041233544232998e-277

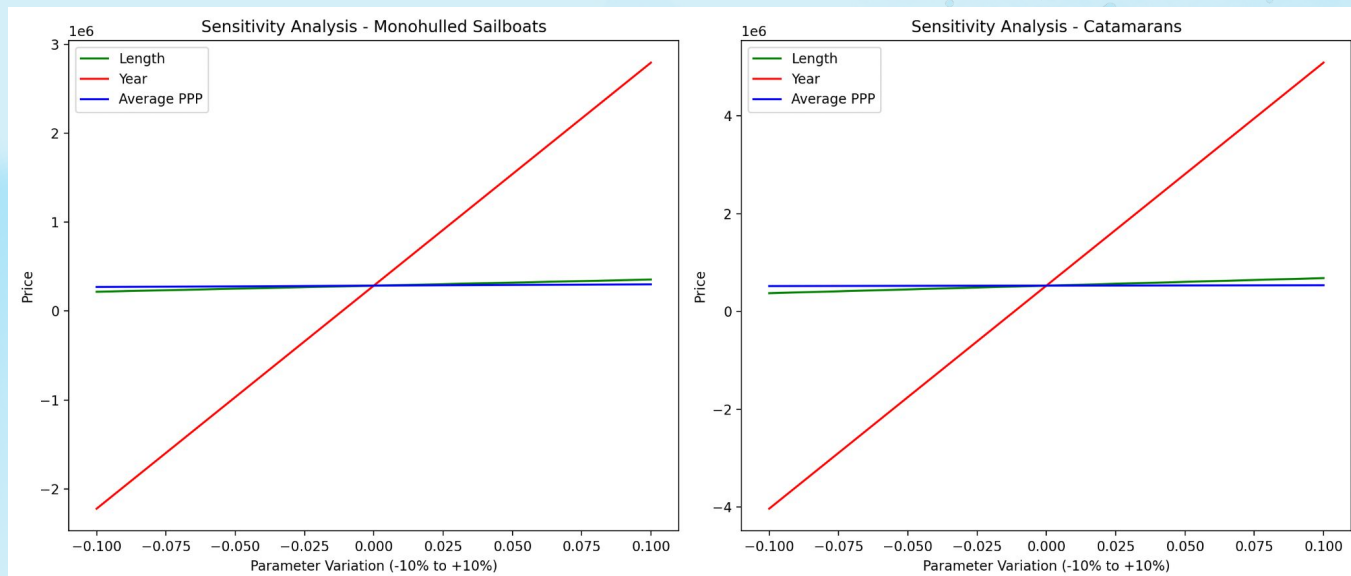

### Catamarans:

- Chi-Square: 433.99564306721896
- P-value: 1.1125282562717235e-68

**Monohulled  
Sailboats' Dataset:**  
**2347** observations

**Catamarans'  
Dataset:**  
**1146** observations

# Sensitivity Analysis

**Change parameters  
from -10% to +10%**

**Fluctuation in Year,  
but not Length and  
Average PPP**

# Regional Impacts

# Purpose and setting up

- To analyze if each region changes the listing price of each variants
- Separating data of catamarans and monohulls sailboats
- Check the significant relationship between region and listing price using the f-test

# F-Test Data - Region

- P-value < 0.05 significance value
- F-value > 1, large variation of difference in pricing

**Table 1.1 F-Test Based on Region**

| Sailboats  | F-Value | P-Value  |
|------------|---------|----------|
| Catamarans | 1.844   | 0.001    |
| Monohulls  | 1.949   | 0.000006 |

# F-Test Data - Average PPP

- P-value, one  $> 0.5$  and one  $< 0.5$
- F-value  $> 1$ , large variation of difference in pricing

**Table 1.2 - F-Test Based on Average PPP**

| Sailboats - PPP | F-Value | P-Value |
|-----------------|---------|---------|
| Catamarans      | 1.842   | 0.0726  |
| Monohulls       | 19.595  | 0.0003  |

# Interpretation from data

- There is enough evidence that shows region affecting listing price (change based on different structure and usage)
- Not enough evidence to tell PPP affects listing price for catamarans however, there is enough evidence for monohulls.

# Hong Kong Analysis

# Precision of Model (Hong Kong Dataset)

## Monohull Sailboats:

$$P = 15187.13 * x_1 + 12450.62 * x_2 + 3.81 * x_3 - 25625815.47$$

$$R^2 = 0.06272794359222178$$

## Catamarans:

$$P = 34204.91 * x_1 + 22645.16 * x_2 + 1.86 * x_3 - 46691648.54$$

$$R^2 = 0.3736596691640808$$

## Chi-Square Test

### Monohull Sailboats:

- Chi-Square: 1464.04448022151
- P-value: 2.041233544232998e-277

### Catamarans:

- Chi-Square: 433.99564306721896
- P-value: 1.1125282562717235e-68

# Regional Effect on Hong Kong

Main question: How does regional effect change listing price in Hong Kong?

# Setting up

How do we do this?

1. Clean the data and create predicted values based on mathematical model for listing price.
2. Combine the predicted values with the actual listing priced from a Hong Kong sailboat dataset.
3. We know that sailboat prices is based on region from previous analysis, so we can analyze the difference in prices based in Hong Kong compared to other regions.

# Some Visuals

Actual vs Predicted Prices - Catamaran

Actual vs Predicted Prices - Monohull

# T - test data

- P - value  $> 0.5$  and  $< 0.5$
- Observe that from the t-value, actual listed prices are higher,
- Monohulls have a higher effect in region

**Table 1.3 - T-Test of Estimated Price and Actual Listing Price**

| <b>Sailboats</b> | <b>T - Value</b> | <b>P - Value</b> |
|------------------|------------------|------------------|
| Catamarans       | 1.4181           | 0.1648           |
| Monohulls        | 2.7910           | 0.0072           |

# Analysis

- In general, different region, means change in listing price
- Why may monohulls be more affected and why is price higher?
  - Hong Kong is surrounded by sea
  - Monohulls are more versatile and hence more in demand

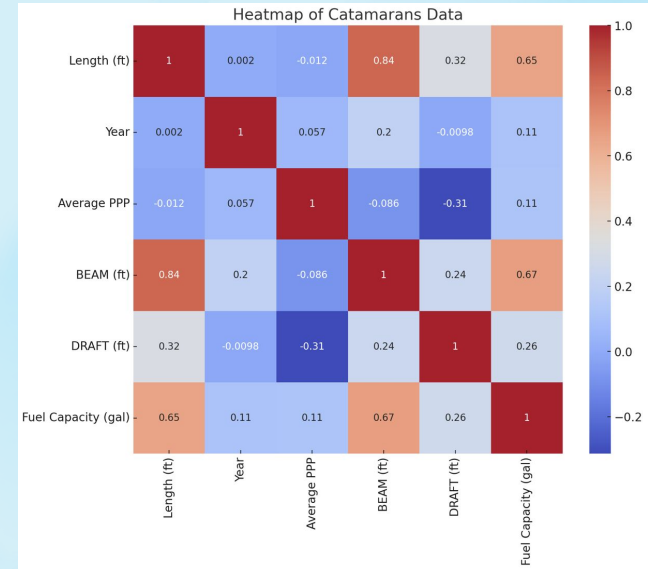

# Additional Findings

# Heatmap Correlation

- Heatmap for both Catamarans and Monohull sailboats was used to find the characteristic correlation.
- Factors between length, year, average ppp, beam, draft, and fuel capacity.
- Strong correlation relationship between length and beam and length and fuel capacity.
- Typically have a larger hull and have a higher structural requirement.
- Width and length of the boat should be more matched to maintain better structural stability.

# Heatmap Correlation

- Strong correlation relationship between length and beam.
- Overall shows less of a correlation relationship between each of the independent variables.
- Correlation with other factors that are not included in the heatmap.

# Strengths

- **2 different methods:** heat map and random forest regression using machine learning
- **Linear regression model** provides clear understanding of relationships between Year, Length, Average PPP, and Listing Price → easy for brokers to predict sailboat prices
- Used **PPP** to account for the varying levels of economic development and wealth
- Analyzing  **$R^2$  values, chi-squared values, p-values**, and created a **sensitivity graph**

# Limitations

- **Only three variables** were used (Length, Year, Average PPP)
- Our linear regression model assumes that the relationship between the variables and price is linear. However, a more **complex regression model**
- We did not analyze the **variability of prices** in each specific region and its underlying factors; we looked at average PPP as a whole

# Conclusion

- Developed a model for second-hand sailboat pricing that includes both monohull and catamaran sailboats
- Collected data from the used sailboat market with factors that has influences on the price such as Make, Variant, Length, Region, Country, Year, Beam, Draft, Displacement, and Fuel Capacity,
- Created a regression model for monohull and catamaran sailboats and analyze the impact of geographic regions on pricing.
- Used the model to analyzed the regional impact for used sailboats in Hong Kong.

**Thank You!**
